

Our Method for Ranking Districts

- Proportions/percentages of the various indicators to be ranked are calculated; these are expressed as a fraction or percentage of a demographic factor such as **population, total number of students, total number of consumers, etc.**
- Standard scores (z-scores) for the distribution of proportions or percentages of the indicators are calculated.
- Ranking is done using the **rank function** in MS Excel. Care needs to be taken to select in the correct order so that observation with the highest proportion is ranked first.
- Verification of rank is done by comparing proportion or percentage to rank estimated, noting the order in which the ranking has been done.
